

WALID WORLD registry

WorldRegistry provides a complete solution for operating and managing a top-level domain name registry. With highly scalable and flexible architecture, WorldRegistry incorporates the core multilingual technology from WorldTools, and utilizes the framework and enabling technologies developed for and used in WorldRegistrar. WorldRegistry offers end-to-end registry functions, including the WHOIS service and DNS zone file generation.

Worldcc provides a complete registry/registrar solution targeted at ccTLDs that wish to migrate from a manual-based domain name registration process to an automated system with incorporated payment processing and DNS server zonefile generation capabilities. Worldcc incorporates WALID's libIDN technology, delivering integrated multilingual domain name registration and management capabilities. Targeted at small to medium-sized registries, WorldCC is designed to provide powerful functionality at an attractive price.

Worldcc allows ccTLDs to convert existing country code extensions, such as .sg and .com.ru, into the characters of the native language. Multilingual domain extensions create more extension choices while appealing to a broader base of users.
